

GARIL AI

AI Governance & Acceptable Use

Responsible AI for research, instruction and learning

Version	1.0
Date	3 October 2026
Audience	Partner universities & institutional stakeholders
Classification	Confidential — authorised institutional use

Important notice

Guidance for institutional adoption of AI-assisted research tools. Universities should overlay local academic integrity and research ethics policies.

1. Purpose

GARIL AI provides governed AI assistance for research and learning. This document sets expectations for universities, supervisors, and students so AI use remains transparent, accountable, and aligned with academic integrity.

2. Platform governance features

- University feature flags — enable/disable research assistant, advanced research, assessment, supervision modules
- Student token quotas — institutional control of AI consumption
- Policy evaluation hooks and AI contribution / provenance records in the governance console
- Audit and integrity-oriented telemetry for AI surfaces where enabled
- Authentication required for AI generation and literature search APIs

3. Acceptable use

- Use AI outputs as assistance — users remain responsible for accuracy, citation, and academic honesty
- Do not submit highly sensitive personal data or special-category data into prompts unless institutional policy and DPA allow it
- Do not use the platform to generate malware, harassment, or content prohibited by university policy or law
- Do not attempt to jailbreak, extract system prompts, or bypass quotas/feature gates
- Respect copyright and licensing when uploading materials for AI context

4. Human oversight

Supervisors and faculty should treat model output as untrusted draft material. Critical claims, statistics, and citations must be verified against primary sources. GARIL AI includes literature retrieval aids but does not replace academic review.

5. Transparency to students

- Institutions should disclose that AI tools are in use in modules/assessments as required by local policy
- Contribution statements / provenance features support disclosure workflows where enabled

6. Model providers

Inference is provided via configured third-party model APIs (see Subprocessors). Prompt and context data are processed by those providers under their terms and the university's DPA schedule.
